

BK Restaurant Client Interview Questions & Sample Answers

Sprint 02 – Issue 01

Client Interview Question Preparation – Nethmi

1. Introduction

BK Restaurant currently manages customer orders, deliveries, inventory, and employee activities manually through phone calls, WhatsApp messages, and physical records. Due to the absence of a centralized management system, the restaurant experiences operational difficulties such as order delays, missing records, communication issues between branches, and inefficient inventory tracking.

To understand the client's business processes, challenges, and system expectations, a client interview session is conducted as part of the fact-finding process. The collected information will support the preparation of the Software Requirements Specification (SRS) and future system design activities.

2. Interview Objective

The main objective of this interview is to gather accurate and detailed requirements for the proposed BK Restaurant Management System.

The interview aims to:

- Identify current business problems and operational challenges
- Understand the client's expectations for the new system
- Gather functional and non-functional requirements
- Identify user roles and stakeholder needs
- Understand current workflows related to orders, deliveries, inventory, and employees
- Collect information required for system analysis and SRS preparation

3. Stakeholder Information

The following stakeholders are involved in the BK Restaurant Management System:

Stakeholder	Role in the System
Restaurant Owner	Monitors all restaurant branches, sales, reports, and overall business operations
Branch Managers	Manage branch-level activities, employees, and inventory
Employees/Cashiers	Handle customer orders, billing, and daily operations
Delivery Riders	Deliver customer orders and update delivery statuses
Customers	Browse menus, place orders, make payments, and track deliveries
Suppliers	Provide inventory items and manage stock requests
System Administrators	Manage system maintenance, user accounts, and technical support

4. Client Interview Questions

Business Background

1. Can you explain the main problems currently faced by BK Restaurant?
2. How are restaurant operations currently managed?
3. What are the biggest challenges in managing multiple branches?
4. What are your main business goals for this new system?

Customer & Order Management

5. How are customer orders currently handled?
6. What problems occur during order handling?
7. What features should the online ordering system include?
8. Should walk-in orders and online orders be managed together?
9. Do customers frequently request order cancellations or refunds?
10. Should customers receive estimated delivery times?
11. Should customers be able to reorder previous orders?
12. What problems do customers usually complain about?

Delivery Management

13. How should delivery tracking work?
14. What information should delivery riders access?
15. How should the rider management system work?
16. What delivery-related problems currently occur?

Inventory Management

17. How is inventory currently managed?
18. What inventory problems occur frequently?
19. What inventory features should the system provide?
20. Should suppliers interact with the system?
21. Should each branch manage its inventory separately?

Employee Management

22. How are employee schedules and leave requests currently managed?
23. What employee-related difficulties currently exist?
24. Should employees receive notifications through the system?
25. How are employee attendance and working hours managed?

Reports & Analytics

26. What reports are important for the business?
27. What information should appear on the dashboard?
28. What type of business analytics do you expect?

Security & Access Control

29. What security features are required?
30. Should different users have different access permissions?
31. Who should access financial reports and sensitive business data?
32. Do you require activity logs to track user actions?

Technical & Non-Functional Requirements

33. How important is mobile responsiveness?
34. How fast should the system respond during busy hours?
35. How important is system availability during operating hours?
36. What should happen if the internet connection fails?
37. How should data backup and recovery be handled?
38. Do you expect integration with external services?
39. Why not continue using existing systems like Uber Eats or Toast POS?
40. Are there future expansion plans for the business?

Final Vision

41. What is the final goal of implementing this system?

5. Sample Answers / Expected Findings

The interview is expected to identify several operational and technical requirements of BK Restaurant.

Expected findings include:

- The restaurant currently depends heavily on manual operations and messaging platforms.
- A centralized restaurant management system is required to manage all branches efficiently.
- Customers require features such as online ordering, order tracking, online payments, and notifications.
- The restaurant needs real-time delivery tracking using GPS integration.
- Inventory management should include stock tracking, low-stock alerts, and supplier coordination.
- Employee management features such as attendance tracking, leave management, and notifications are required.
- Different users require different access permissions and dashboards.

- The system should provide sales reports, inventory reports, and business analytics.
- Mobile responsiveness, security, data backups, and system reliability are highly important.
- The restaurant plans to expand its operations in the future, requiring a scalable system architecture.

6. Summary

The client interview process is an important fact-finding activity used to gather detailed requirements for the BK Restaurant Management System. The interview questions focus on business operations, customer management, delivery processes, inventory handling, employee management, reporting, security, and technical requirements.

The collected information will be used to prepare the Software Requirements Specification (SRS), identify system functionalities, and support future system design and development activities. The interview findings will also help the project team better understand stakeholder expectations and business goals.
