

BK Restaurant Client Interview Questions & Sample Answers

Sprint 02 – Issue 01

Client Interview Question Preparation – Nethmi

1. Introduction

BK Restaurant currently manages customer orders, deliveries, inventory, and employee activities manually through phone calls, WhatsApp messages, and physical records. Due to the absence of a centralized management system, the restaurant faces operational challenges such as order delays, missing records, communication issues between branches, and inefficient inventory tracking.

To understand the client's business processes, challenges, and expectations, a client interview session is conducted as part of the fact-finding process. The collected information will support the preparation of the Software Requirements Specification (SRS) and future system analysis activities.

2. Interview Objective

The main objective of this interview is to gather accurate and detailed requirements for the proposed BK Restaurant Management System.

The interview aims to:

- Identify current business problems and operational challenges
- Understand the client's expectations for the new system
- Gather functional requirements
- Identify user roles and stakeholder needs
- Understand current workflows related to orders, deliveries, inventory, and employees
- Collect information required for system analysis and SRS preparation

3. Stakeholder Information

The following stakeholders are involved in the BK Restaurant Management System.

Stakeholder	Role in the System
Restaurant Owner	Monitors all restaurant branches, sales, reports, and overall business operations
Branch Managers	Manage branch-level activities, employees, and inventory
Employees/Cashiers	Handle customer orders, billing, and daily operations
Delivery Riders	Deliver customer orders and update delivery statuses
Customers	Place orders through phone/WhatsApp and receive deliveries
Suppliers	Provide inventory items and manage stock requests
System Administrators	Manage system maintenance, user accounts, and technical support

4. Client Interview Questions

1. Business Background

1. What is your main goal for introducing a new management system?

2. What are the main challenges with managing the restaurant manually?
3. How are restaurant operations currently managed on a daily basis?
4. What are the biggest challenges in managing multiple branches?

2. Order Handling

5. How are customer orders currently received and recorded?
6. What problems usually occur during order handling?
7. How are orders communicated to the kitchen staff?
8. How are order changes or cancellations handled?

3. Delivery Management

9. How are deliveries currently assigned to delivery riders?
10. What challenges occur during the delivery process?
11. How is delivery status currently monitored or communicated?

4. Inventory Management

12. How is inventory currently tracked and updated?
13. What common problems occur in stock management?
14. How are stock shortages handled?
15. How do branches request inventory items from suppliers?

5. Employee Management

16. How are employee schedules and shifts managed?
17. How is employee attendance currently recorded?
18. What difficulties exist in managing employees?

6. Business Requirements & Expectations

19. What are your main requirements for the new system?
20. What is your definition of done for this project?
21. What would make you consider the system successful after implementation?

5. Summary

The client interview process is an important fact-finding activity used to gather detailed requirements for the BK Restaurant Management System. The interview questions mainly focus on current business operations, order handling, delivery management, inventory control, employee management, and overall business challenges faced by the restaurant.

The collected information will be used to prepare the Software Requirements Specification (SRS), identify required system functionalities, and support future system analysis and design activities. The interview findings will also help the project team better understand the client's goals, operational problems, business requirements, and expectations for the new system.
